

7 INDICATIONS you need cyberthreat intelligence services

1 You've had a recent incident or breach

If your company has experienced a recent incident or an increase in security events, it is possible that you might have been compromised and need a further investigation.

2 You believe your data might not be secured

If you believe that company or customer data might not be properly secured according to best practices, it is possible threat actors have also noticed and stolen information.

3 You're considering acquiring a company or want a review on a subsidiary company

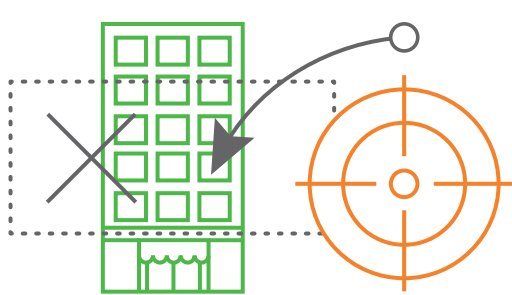

If you are considering buying a new company, working with a new vendor, or want a review on existing subsidiary companies, RSM CTI services can provide a holistic review and identify any potential risk areas.

4 You're noticing numerous vulnerabilities within company infrastructure

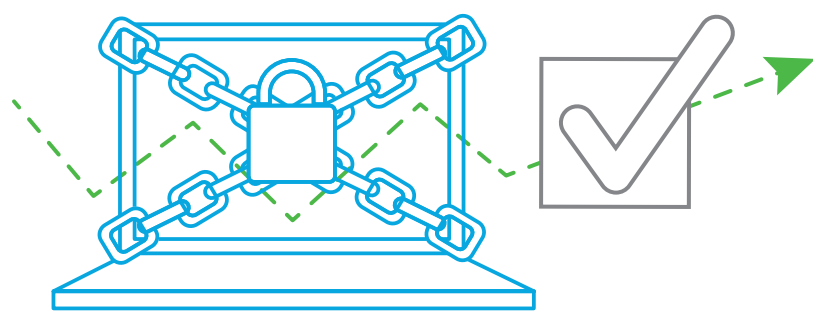

If recent penetration tests have discovered critical, high and medium vulnerabilities exist across your network, a CTI review can help determine if these exploits have already been leveraged by threat actors.

5 You have external and internal actors targeting your company

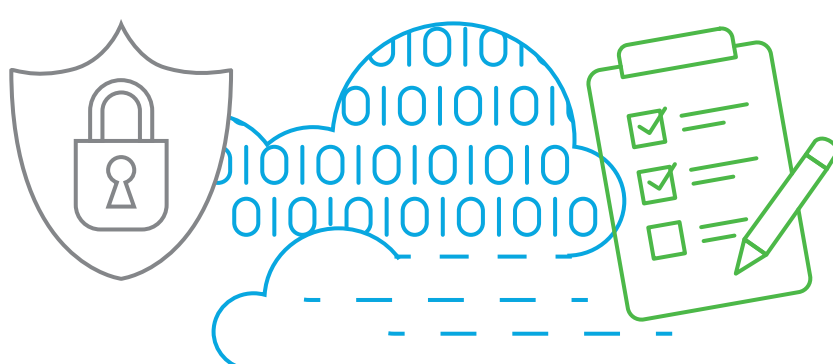

If you believe your company is being targeted by internal or external parties for data theft, reputational damage or system compromise, a CTI review will help provide context based on tactics, techniques and procedures (TTPs) seen in the wild.

6 You want to understand industry cybersecurity trends

If your company needs to determine overall threat actor, campaign and malware trends targeting the industry, a CTI service can provide strategic, operational and tactical intelligence.

7 You've never previously conducted a due diligence sweep for exposed data

How can you protect yourself if you do not know what data is possibly accessible on open and closed sources?
